

# Mapping Intertidal Reefs on Lord Howe Island

Caitlin Woods, PhD Candidate

Centre for Sustainable Ecosystem Solutions (CSES) – University of Wollongong

Supervisors: Andy Davis and Kirsten Benkendorff

# Intertidal reefs on remote islands have high conservation value

- Unique and diverse assemblages
- Many endemic species (examples shown)

# The distribution of intertidal reef biodiversity in a World Heritage listed marine park

- Using habitats as surrogates to infer patterns of biodiversity
- Multiple reef types

**Basalt platforms**

**Mixed boulder**

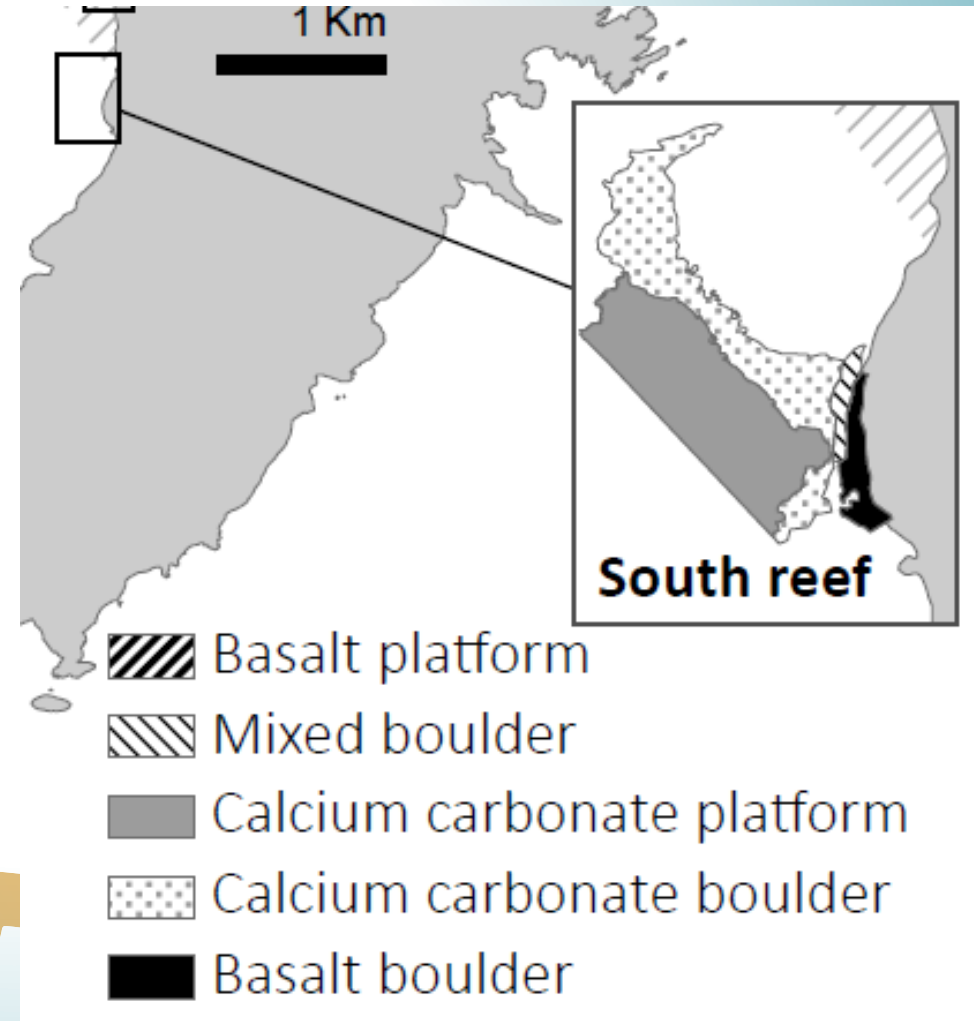

**Calcium carbonate platform**

**Basalt boulder**

**Calcium carbonate boulder**

## Other habitat variables influencing biodiversity

- Reef elevation (above sea level) <sup>1</sup>
- Reef slope <sup>2</sup>
- Reef aspect (which direction the reef surface faces) <sup>3</sup>
- Reef complexity (rugosity) <sup>4</sup>
- Distance to the seaward edge <sup>5</sup>

## Drone aerial photography

- Using photogrammetry to reconstruct 3D models (digital elevation models) of intertidal reefs
- Enables precise measurements of habitat characteristics

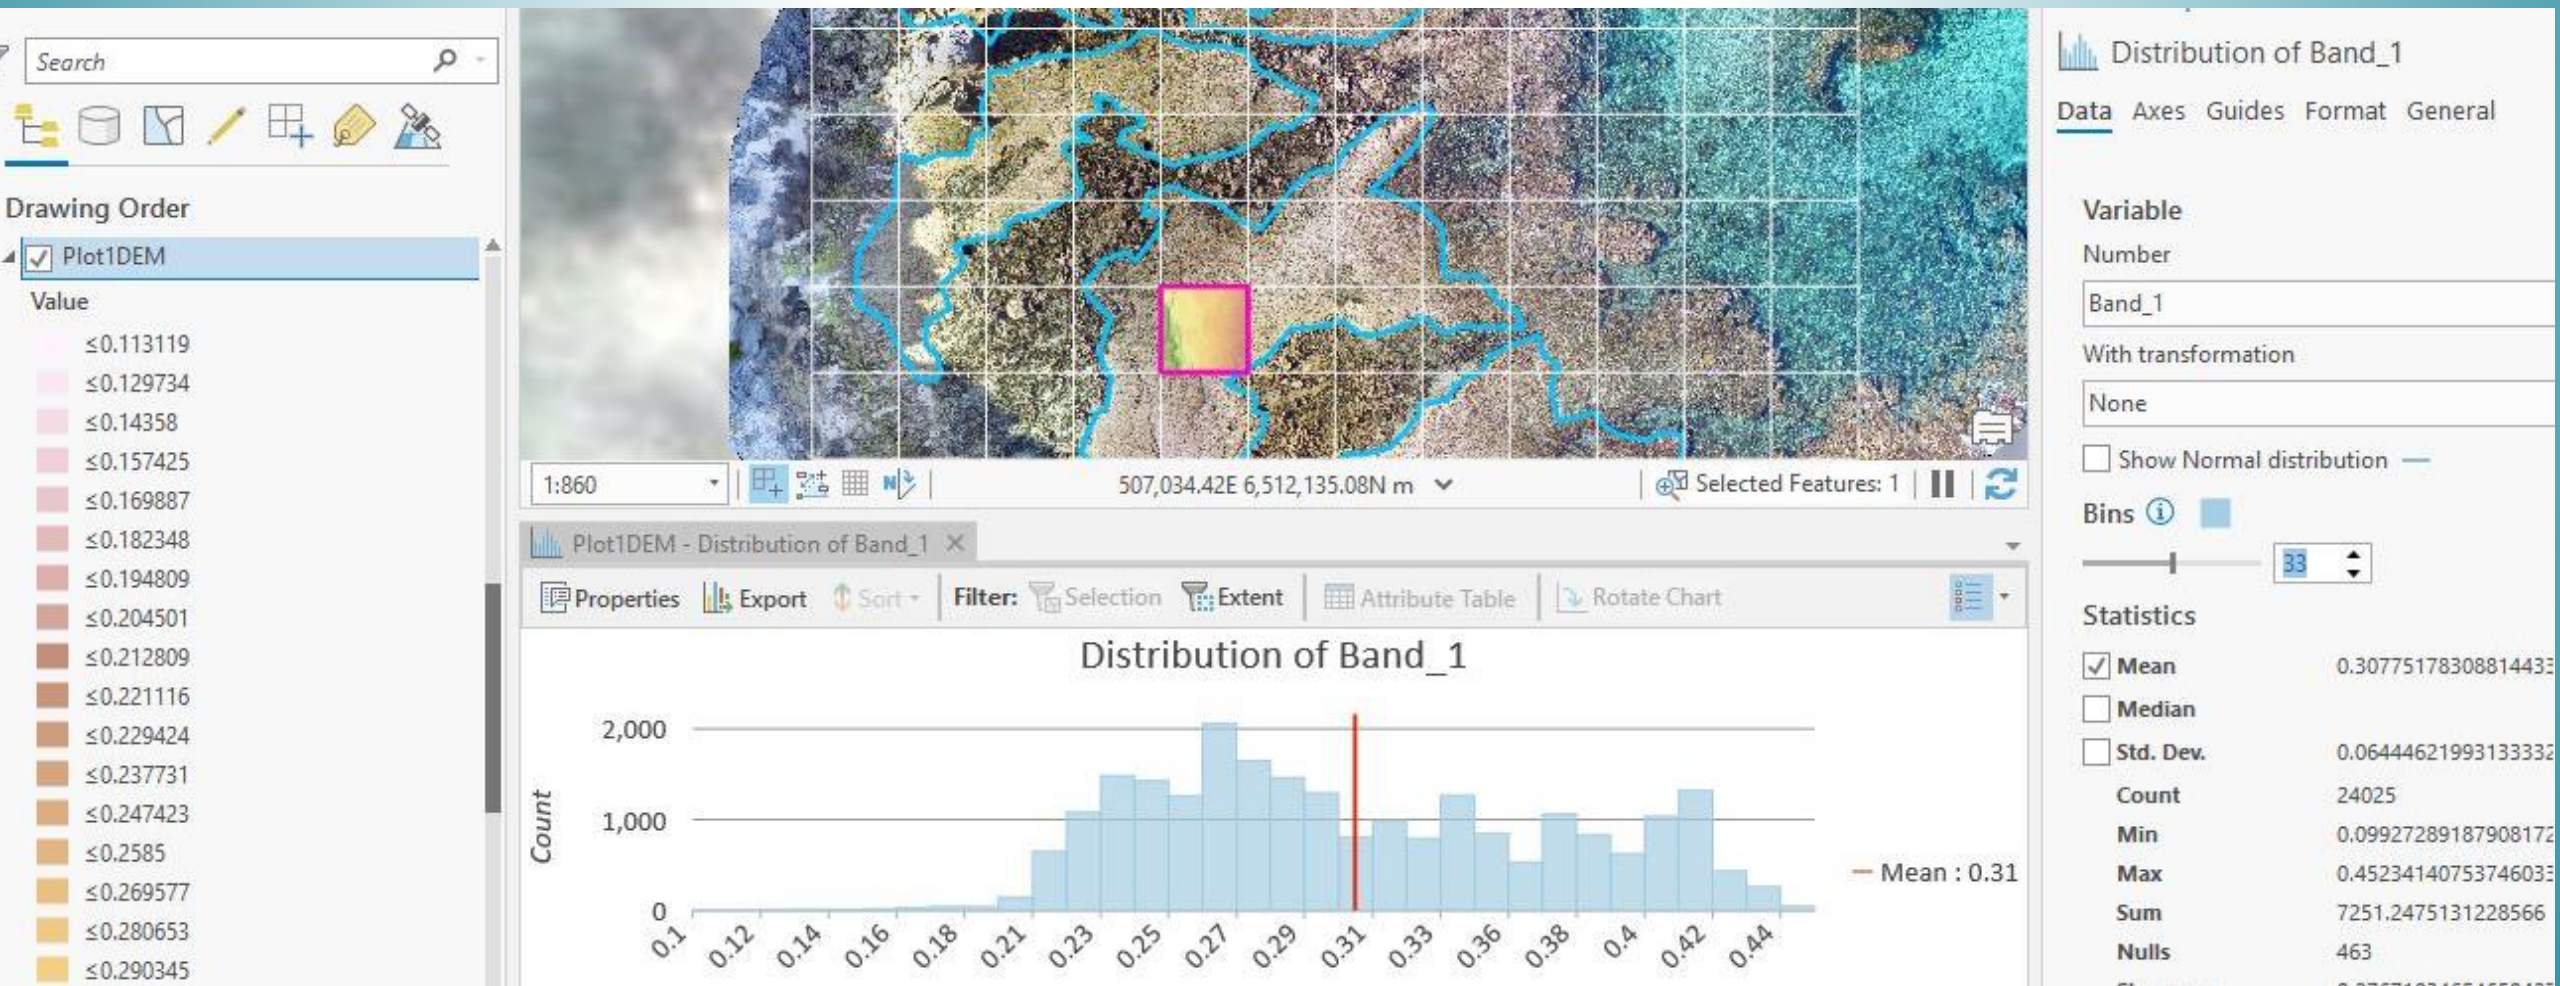

## Visual surveys of target organisms

- 10m x 10m plots
- Generated using spatially balanced random sampling, geolocated
- Identity and abundance of solitary macro-invertebrates recorded
- 15,600 square metres of habitat surveyed in total

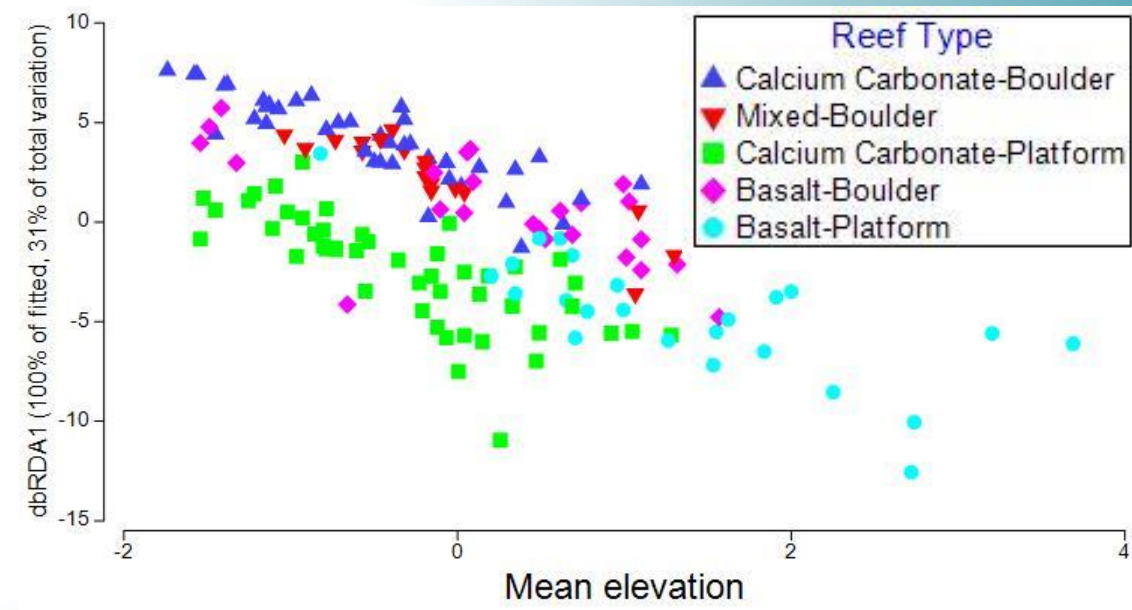

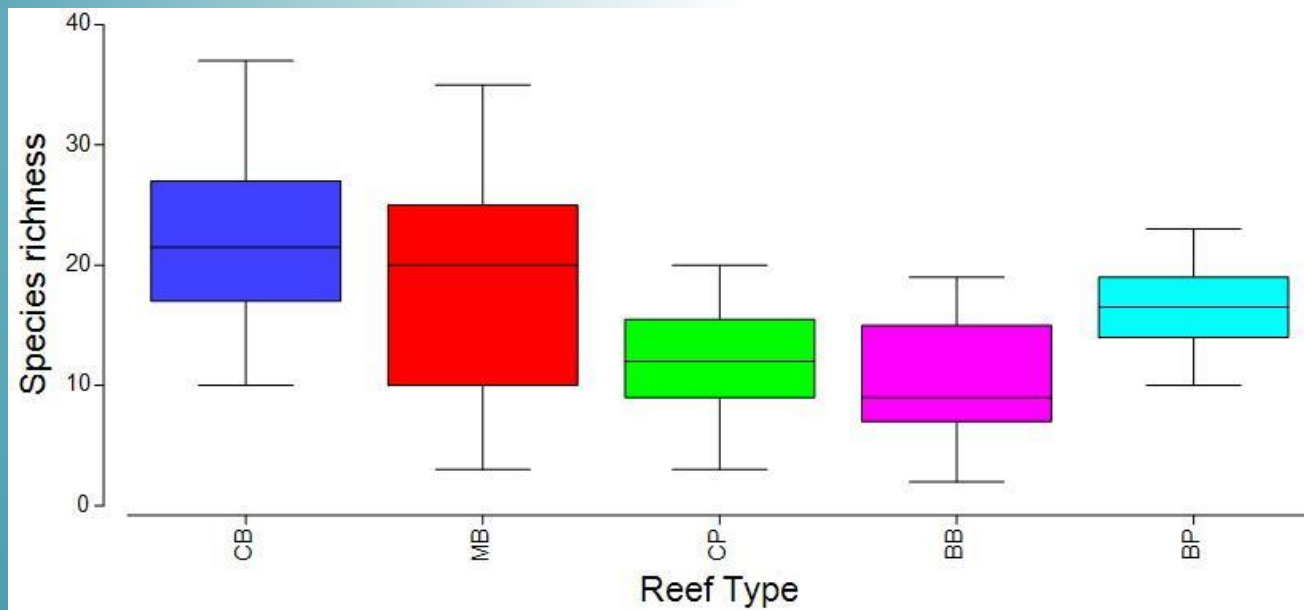

# Measuring habitat characteristics of plot in ArcGIS

- Measures of central tendency, minimum, maximum and range for each plot

# Determining which habitat characteristics best explain diversity

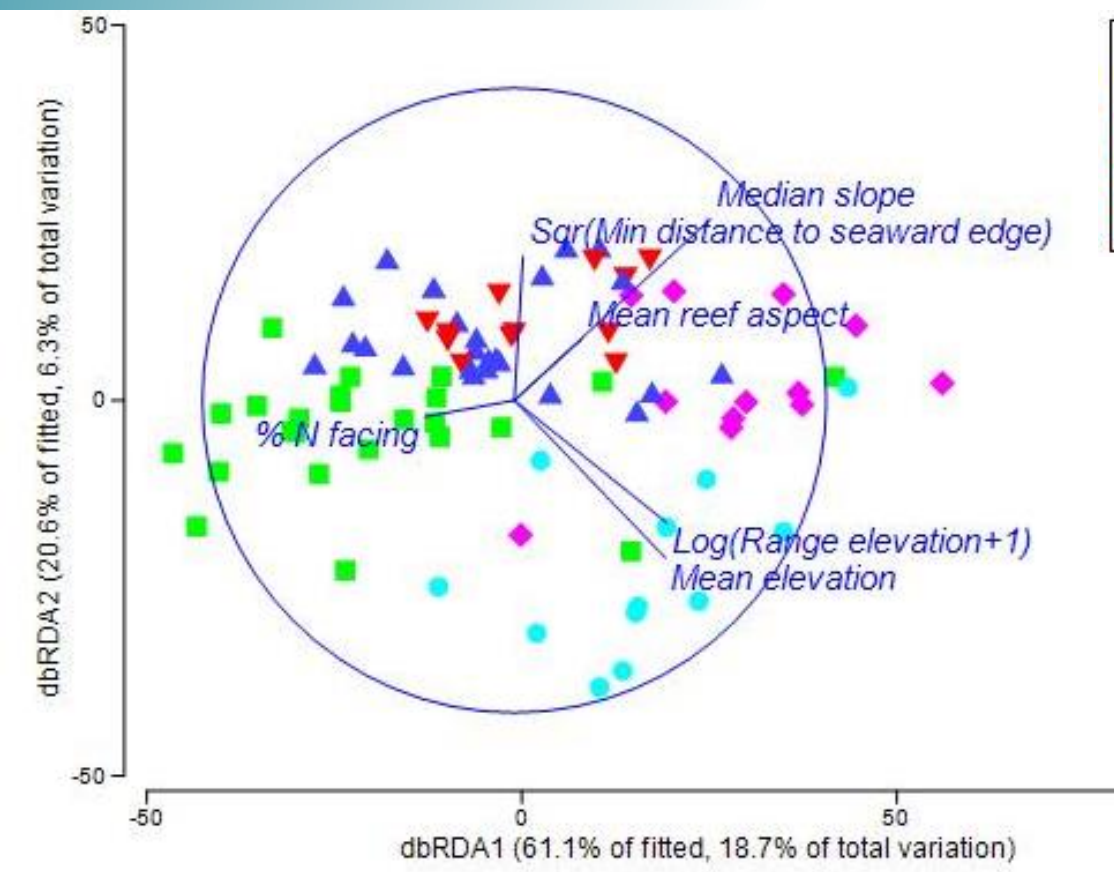

- Examine differences in diversity between reef types
- Regression analysis to determine which reef characteristics explain these differences (i.e. elevation)

# Determining which habitat characteristics best explain variation in assemblage structure

- Distance-based linear analysis to identify which characteristics explain overall patterns
- Identify whether different characteristics explain patterns within each reef type

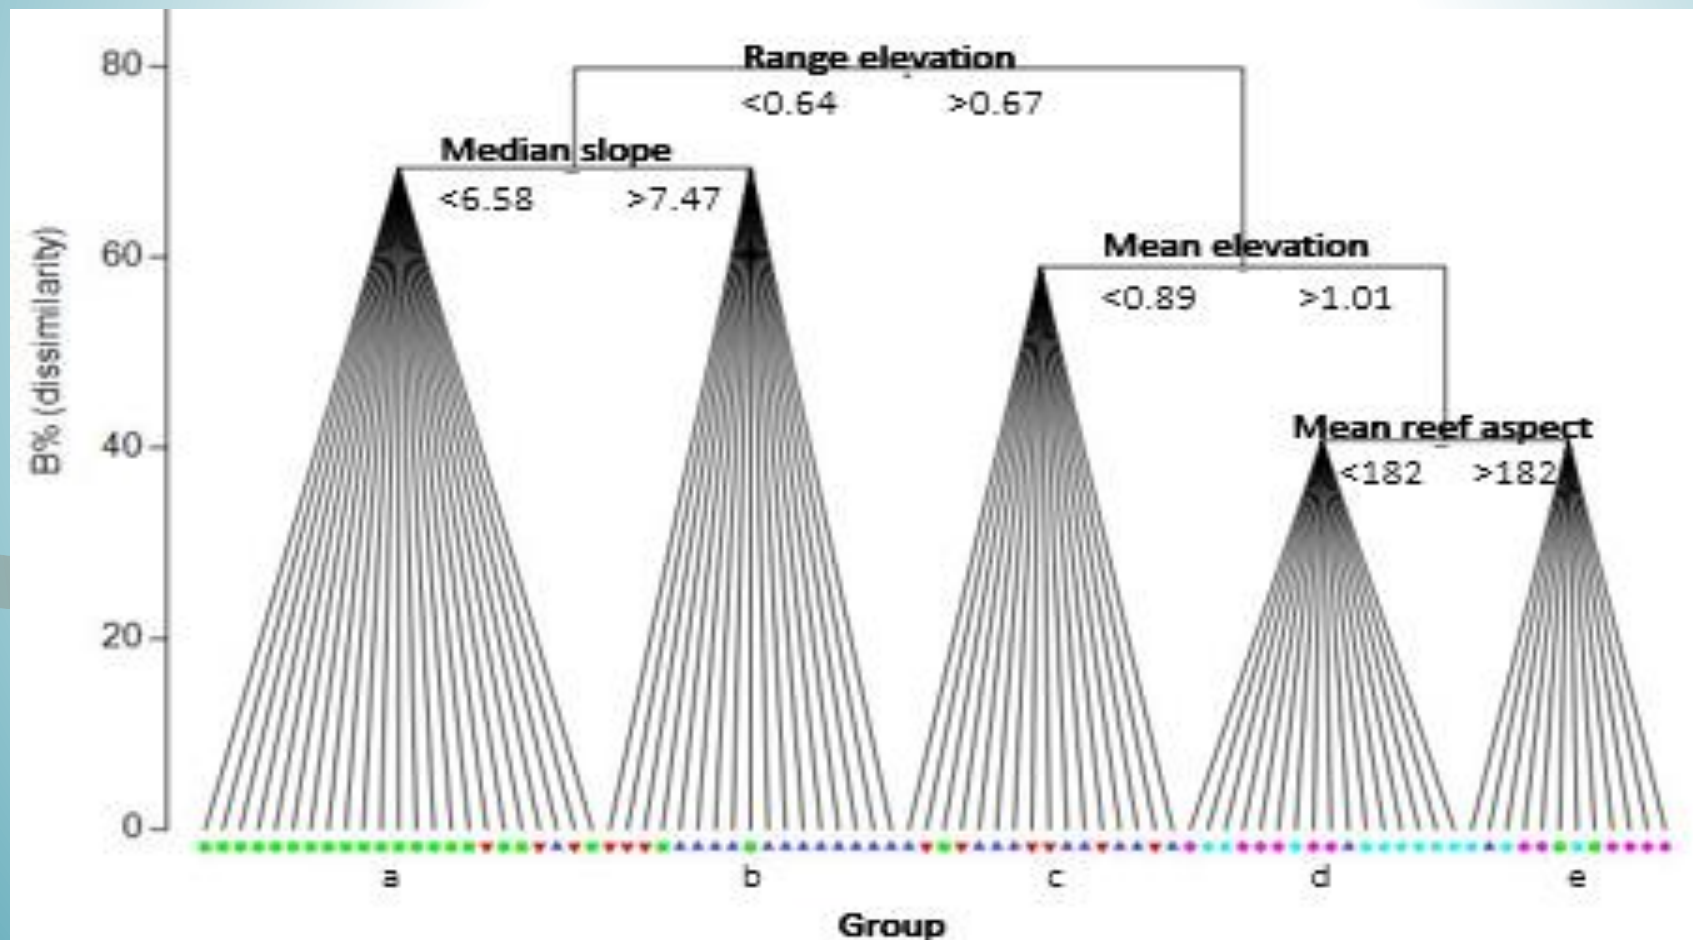

Reef Type	
▲	Calcium Carbonate-Boulder
▼	Mixed-Boulder
■	Calcium Carbonate-Platform
◆	Basalt-Boulder
●	Basalt-Platform

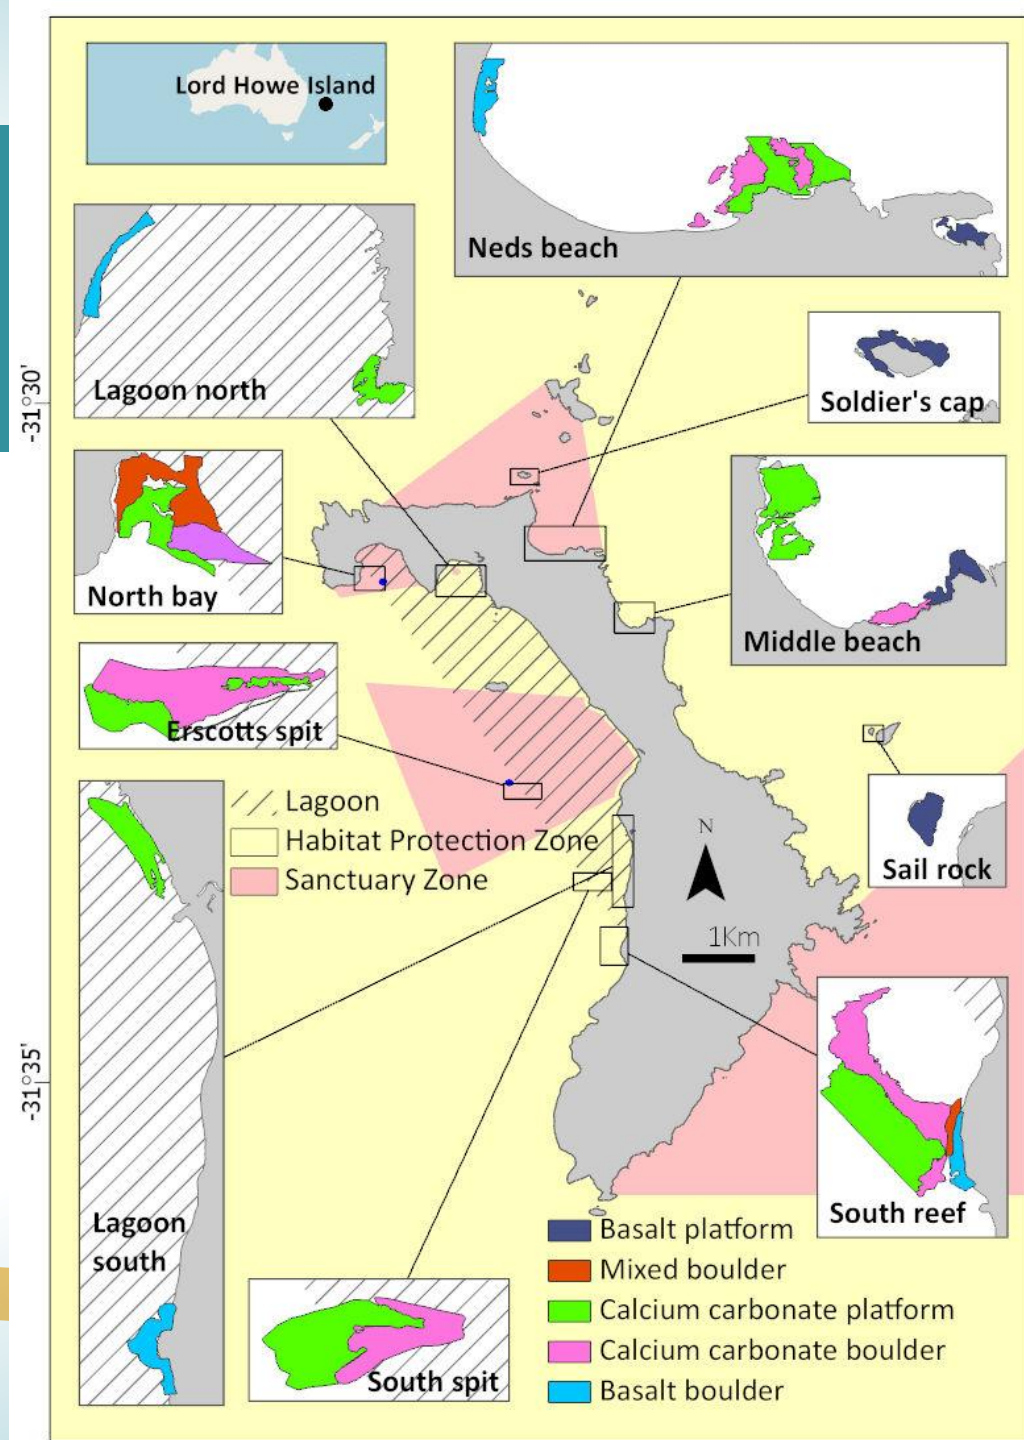

Reef type	BEST selection % variation explained	Selected variables
Calcium carbonate boulder	7	<u>Sqr</u> (Min distance to seaward edge)
Calcium carbonate platform	12	<u>Log</u> (Range elevation+1)
Basalt boulder	30	% W facing
Basalt platform	23	% W facing
Mixed boulder	45	<u>Log</u> (Range elevation+1) Mean reef aspect

## Developing and testing habitat classification schemes

- Using clustering algorithms
- Test predictive success rates on independent data

Synthesize results to predict patterns of biodiversity throughout the Lord Howe Island Marine Park and inform conservation management
